

• Contents/Topics For Python Course

- Module 1
 - An Overview of Python
 - The Philosophy of Python
 - Python 2 vs Python 3
 - Installing Python 3 on Windows
 - Installing Python 3 on Linux
 - Python IDEs
- Module 2
 - Whitespace in Python
 - Read, Evaluate, Print, Loop
 - Hello world
 - User Input
- Module 3
 - Modules and Imports
 - The int Type in Python
 - The float Type in Python
 - Basic Math Functions in Python
- Module 4
 - The bool Type in Python
 - The str Type in Python
 - The bytes Type in Python
 - The bytearray Type in Python
- Module 5
 - The list Type in Python
 - The tuple Type in Python
 - Slicing in Python
 - The range Type and Function in Python
 - The set Type in Python
 - The dict Type in Python
- Module 6
 - The while Loop in Python
 - The for Loop in Python
 - The if Statement in Python
- Module 7
 - NumPy Mathematical Library in Python
 - Dimensions of Array
 - Array operations

- Create a Rank 2 Array
- Create Numpy Array of 3x3 with all zeroes
- Create a 2 x 2 Array with all ones
- Create a 3 x 3 Array with constant values
- Create a 3 x 3 Array with random values
- Create Identity Matrix
- Create a 3 x 3 matrix with random values with in range
- Array to List conversions
- Module 8
- Datatype management in Arrays
- Create linear values of evenly spaced numbers with in a range
- Grid Indexed Arrays
- Automatic and Forced Datatypes in Arrays
- Slicing in Arrays
- Module 9
- Pandas Data Management Library
- Create Series in Pandas
- Create 2D Objects similar to SQL Table
- Reading and Writing Data using pandas
- Reading a CSV File
- Reading a TXT File
- Reading an Excel File
- Reading different Excel sheets with in one file
- Reading from MySQL Databases
- Module 10
- Compute Count, Mean, Standard Deviation, Minimum, Maximum
- Compute covariance between columns in DataFrames
- Compute correlation between columns in DataFrames
- Head, Tail, Columns, Data types operations on DataFrames
- Get unique values from columns in DataFrames
- Get row wise values from columns in DataFrames
- Implement Sorting in Data Frames
- Implement Select Statements in Data Frames using Conditions
- Select rows from Data Frames using Row Indexes
- Select rows from Data Frames using Positions
- Select rows from Data Frames using Matrix Style
- Module 11
- Faster alternative to get scalar values from Data Frame
- Transpose operations on Data Frames

- Filter operations on Data Frames using Single Columns
- Filter operations on Data Frames using Multiple Columns
- Date Series conversions
- Rename columns in Data Frames
- Mark duplicates in Data Frames
- Drop duplicates from Data Frames
- Drop missing values from Data Frames
- Add new columns in Data Frames from Lists
- Compute cumulative sum of each column in Data Frames
- Merge and Join operations
- Module 12
- Matplotlib Graphical Library
- Create a bar plot
- Create a scatter plot
- Create a box plot
- Create a histogram
- Create a line Plot
- Create a bar plot for Student and Marks Scored
- Customization of Plot Labels
- Create Multiple Line plots on same axis
- Create Multiple Line plots on multiple axis
- Line Styles and Markers for graphs
- Module 13
- Data Transformation techniques in python
- Label Binarizer
- Label Encoding
- Standardization of data
- Normalization of data
- MinMax scaling of data
- Exploratory analysis in python
- Correlation Histogram Plots
- Correlation Matrix
- Projects Covered
- Student Test Grade Prediction System
- Live Cricket Score Prediction System
- Attacker Detection and Prediction System
- Mobile User Activity Identification and Prediction System
- Breast Cancer Diagnosis System
- Fake / False Comments & Feedback Identification system
